A. Input. Model, labeled reference data, production windows, optional audit labels.
B. Preparation. Feature typing, image embeddings, data split.
C. Detection and estimation. Shift tests, accuracy estimate, localization.
D. Drift type and cause. Tests name the type; SHAP or CAM explain the change.
E. Reliability. Risk of each prediction from confidence, OOD score, instability.
F. Remediation triage. Predicts whether a cheap retrain will help.
